Attendance in primary school

Factors and consequences

Galina Daraganova, Killian Mullan and **Ben Edwards**

Correlates of non-attendance age 6-7, Wave 2

	Odds Ratio		Odds Ratio
Pre-Year1 (ref: Year 1)	1.85**	Lone parent	1.14
Year 2 (ref: Year 1)	0.92	Mother not working	1.35**
Girl	1.15	Parent with degree	1.17
Indigenous	1.55*	On benefit	1.29*
Delayed	0.80	Regional	1.19*
Child speaks language other than English	1.00	Consistent parenting	0.83
Repeated grade	0.69	High parenting self-efficacy	1.10
Child is bullied	1.29**	Not satisfied with school	0.85
Medical condition or disability	0.99	Parental expectation for high education	0.74**
Who Am I?	0.99*	Involvement with school	1.02
Emotional or behavioural problems (SDQ)	1.02*	Catholic school (ref: Government school)	1.05
Likes school	1.08	Independent school (ref: Government school)	0.96
Likes teacher	1.14		

Implications: Correlates of attendance

- As children age:
 - ◆ Fewer factors related to non-attendance
 - ◆ Family factors less important
 - ◆ Previous non-attendance more important with age suggesting self-sustaining process (ATSI, income support recipients)
- Mothers not working could assist in the socialisation of non-attendance
- School readiness important

Influence of absenteeism on academic achievement: Numeracy

- Early non-attendance (8-9 years) important
- Thereafter the influence on numeracy 10-11 years indirect through numeracy at 8-9 years

What offsets the effects of non-attendance?

- Early primary school is the optimal time to target school attendance and numeracy interventions
- Children with lower school readiness have higher levels of absenteeism
- Protective factors:
 - ◆ High levels of non-verbal ability
 - ◆ When parents have a university degree
 - ◆ Parental expectations are high

The long term outcomes of victims and perpetrators of bullying: Evidence from longitudinal studies

Ben Edwards, Suzanne Vassallo and Jennifer Renda

Meta-analysis: Bully victimisation and later depression- unadjusted effect sizes

Meta-analysis: Bully victimisation and later depression -adjusted effect sizes

What about bullies? Bullying perpetration and later antisocial behaviour

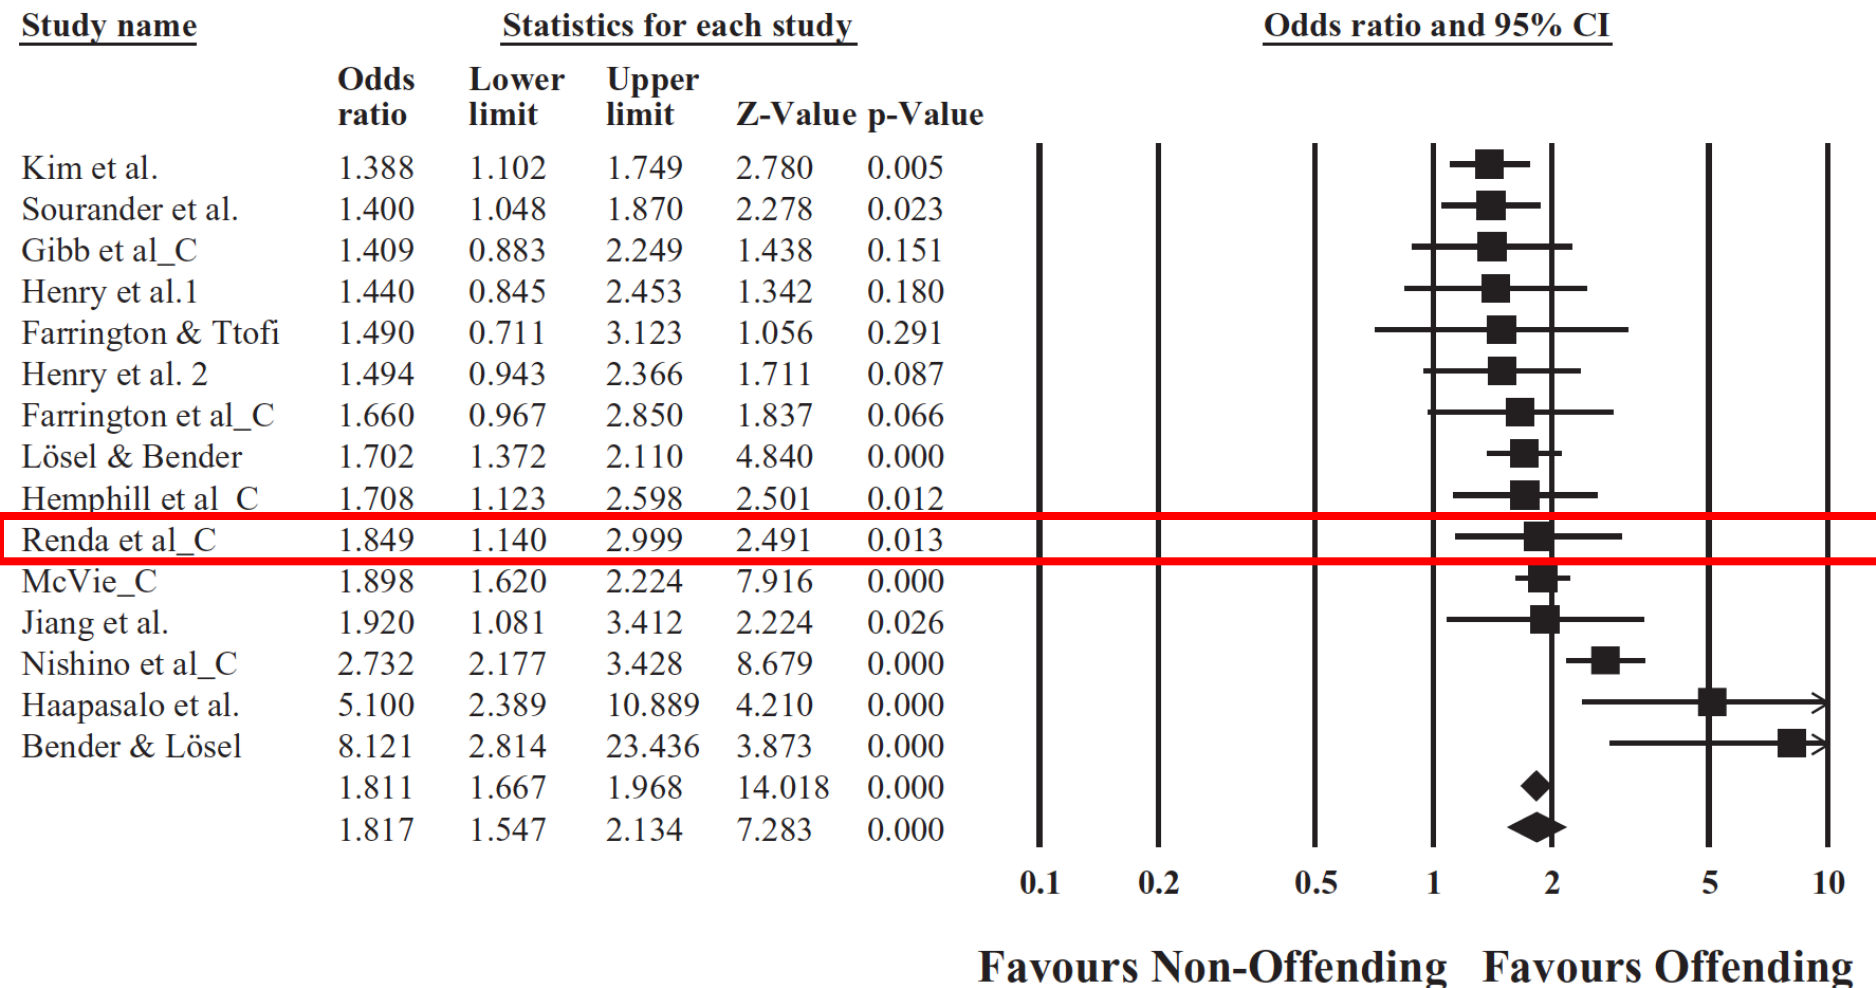

Australian Government

Australian Institute of Family Studies

Meta-analysis: Bully perpetration and later offending -unadjusted effect sizes

Meta-analysis: Bully perpetration and later offending -adjusted effect sizes

What factors are protective?

What factors protected

- adolescent bullies from becoming antisocial young adults; and
- adolescent victims of bullying from subsequent depression?

Protective factors –Summary

- Many examined, few protective
- ASB –low negative reactivity AND parental monitoring
- Depression –High social skills and understanding school work
- High peer attachment a risk factor for depression in bullied children

Bullying at 13-14 and anti-social behaviour at 23-24 years– interactive protective factors
